Job Title –Software Developer (Front-end Data Visualisation)
Location – Bristol, UK
Employment – Full Time, Permanent
Salary – Competitive
Apply – CV to jobs@unrival.net

Background

Unrival is a fast-growing B2B 'scale-up' based in Bristol, United Kingdom, working to provide data-driven insights to guide marketing and commercial decisions in some the world's largest enterprise technology, telecommunications and energy companies. The business is based in Bristol and London, but we work globally with enterprise clients across Europe, North America and Asia Pacific.

The company, (primarily a services business today) has got its product to market, is profitable and has grown revenue 100% YoY. The company is run by two entrepreneurs, an experienced management team and is supported by angel investors and a board of directors who have built, scaled and exited numerous technology businesses. The company is now entering a new phase of growth and is looking for a data visualisation genius to help take our analysts work into a scalable digital platform.

The keys to success with this role are creating tools which make our team more effective, and development of our platform to deliver this work on to clients at scale – you will be directly responsible for making this happen.

The products – created by Unrival are sophisticated organograms, in-depth profiles and market indexing which are used by clients to support Account Based Marketing and Sales conversations with clients. These products are very unique and highly valued by our clients – this results in high levels of virality and repeat business which has led us to our success so far.

The Opportunity

Due to unprecedented demand by clients for our product, and considerable organic growth, the need to evolve the delivery of Unrival's products is one of our number one priorities to support our next stage of growth.

This role, is one of our first engineering hire's in our history, which will help to shape the technology road map and help to bring the vision for our product to life.

Unrival's products are highly visual data visualisations, so a flair for design and ability to translate complex data into beautiful, user friendly outcomes is essentially.

You will be involved in the key decision making and execution around how we translate both internal research requirements into tools, as well as development of our external platform to clients.

Job Description

We need a developer with high energy and deep skills to work on both client projects and core engineering projects.

We need projects delivered with impeccable execution to provide a seamless end-user experience to our enterprise clients – knowledge of changes or support for HTML5, JavaScript and CSS across browsers is essential. Additionally, you will help prioritize the product roadmap based on customer feedback and project experience.

Skills and knowledge

First and foremost, you must be a self-starter. We're looking for someone who can work independently, learn what needs to be learned, and generally "get stuff done". We expect this candidate to take charge of their role and drive results. We're a small team and we work collaboratively and openly to help each other succeed.

 Essential Skills
- 3+ years in web application development (CSS, HTML, JavaScript)

- Experience with consuming RESTful APIs
- Excellent academic qualifications

<u>Additional Skills</u>
- Experience in working with component based UI libraries e.g. Vue.js, React.js, etc
- CI/CD
- Experience in data visualisation (please send us examples)

<u>Ideal</u>
- Experience in working with a product manager and translating user requirements into code
- "Agile" based methods of delivery
- Collaborating with backend developers to define APIs
